

SQLi1 and SQLi2

Category Web

Difficulty Easy/Medium

Points 200/200

Description: This is my first time using SQL. Its such a great and simple tool // Ok I upgrade my security by preventing you from using semicolons. A stackoverflow thread told me that would work. (Web Containers)

Ok, so for both of these I just used the same payload. It is the general payload that works for super easy SQL injection flags.

' OR 1=1 #

About the payload, remember # is comment for MySQL. If the database is Oracle, or like PostgreSQL, then it # would be replaced with -- instead. (Just dash dash).

And any quick gibberish for email, I was using chrome not firefox lol so it forces me to type something in email field.
